#### **OLUME XI**

# DETERIORATION

RECUPERATION OF SOILS,

To the Commissioner of Agriculture In undertaking to examine into the restoration of our lands that have been in long cultivation to a larger productiveness, it is well to look into the causes of their fertility. When Kentucky was first settled

by the white man, nearly the entire area was a denso forest, the undergrowth, the cane, etc , preyented the loss of seil by rains carrying it into the branches, creeks or rivers. Everything that grew upon the land was returned to it, and was not carried away by rain-storms; the leaves of the trees were annually returned, so of all the plants that were produced; trees would grow to maturity and finally decay upon the land, thus returning all the plant-food, that, in their development, had been taken from it, the soil thus being kept to its highest degree of fertility. Not only this, but there was a constant increase in fertility, over and above any loss that may have occured locally by the food of the beasts of the forest and birds of the air; by the annual change in ferm of the minerals of the soil into plant-food. The same process is still in full operation. releasing the lime, the phes-The section of the State form which where phosphate of lime is absent from the soil, unless it is artificially

supplied, But te return: it must be apparent to any one who thinks that the loss of fertility of Kentuel:y lands, before the destruction of the forcets, must have been very small. How is it now? All of the early cleared fields where at all relling, have lost largely of their surface soil, in many instances to the subsoil and rocks, and furrowing the hill-sides with deep guilies.

The loss to our land from this cause can not be computed, and is without romedy. Every valley has received large accumulations, overy branch and creck has been choked by the deposits in them, and even the Mississippi has received contributions from this source. All this irreparable loss has grown out of the original low price of our lands, and the rush for accumulation, without one thought upon the fact that these lands are in our hands as a trust for the generations to succeed us; we have no moral right thus to deplete them. The writer knows of a creek, which in his boyhood days, had a grist-mill on it every two or three miles. The current of the stream was strong, running over a rocky bed, and filled with the finest eral elements necessary to the growth creek fish. Now, there is not a mill of this plant are in sufficient availaon it in its whole length; miry beds and miry crossings; not a fish in it. and only a narraw channel, nearly the land can not produce it. Why, choked. Every observing farmer

must have noticed this. It is done, and all that we can do is to preservo what we have, and, with the heat from his land by his crop, and return management, more or less loss will occur. The ancient and interesting land of Palestine ought to be, in this matter, a lesson to the people. Once one of the most fruitful of all away more than 150 to 200 pounds. lands, having its hill-sides terraced The processes of nature will restore so as to prevent its soil from wash- part of this, and 150 to 200 pounds ing away; the most fruitful vineyards sulphate of potash, crushed fine and were found on these terraces. Now, sowed upon the land broadcast after under the control of its present pop- it is prepared for planting, will be ulation, these terraces are broken, an ample supply for an acre of land. the hillsides denuded to the bare This will not or need not cost the rock, and a scene of desplation exists farmer more than \$2.50 or \$3 per How long shall this "goodly land" slacked lime or tand plaster would that man's puny arm cannot rostore. be trodden under under toot by these probably assist materially, unless College will cheerfully give them all He is an advocate of early rising vandals? Possibly enough has been the land is underlaid with limestone; said on this point of injury to our in that case the lime would not be sum of money is being expended lands by the destructive influence of necessary. All other elements are yearly by farmers for commorcial washing rains, the design being in such small supply in tobacco merely to draw attention to this that an abundance of them is to be point, so that in the future we may found in nearly all soils, unless it under the present law, they can have our minds more directed to its be phosphoric acid and nitrogen.

> ing; we do not possess creative powers. There can be no greater tolly than for any man to attempt to cullivate, by plowing, exhausted land, without first adding to it the resd that the crop he purposes to plant requires. Take as au illustration tobaeco, a crop with which so many farmers in the State are familiar. Its largest mineral element is potash, and unless the soil be new, or has been recuporated by years in grass, the effort will be a failure; tobaeco will not grow without a liberal supply of potash in the soil. This plant appropriates a largo amount of petash in its growth, and soon exhausts the available supply. Two or three erops in succession are as many as most of our lands will stand. then a rest for a few years in grass will bring it into condition to produce tobacco, the slow processes of

ash to produce it. It is not positively eertain, but highly probable, that all other minble supply for its growth, but in consequence of the want of potash then, should not the tobacco-grower, after taking his crop off, estimate how much potash has been removed that much to the soil before planting another crop? This can be done at comparatively small cost; the best crop of 1,200 to 1,500 will not take hundred; the addition of some

beir Origin and Their Louding Charge Raral Nam Varker discourage as fulbrown, the latter being the preferred

Patagonian. A thrilling taie of a seaman who found a coop of these birds on give the breed a start. It went up like a rocket, but came down heavier than a the eggs, some of which failed to hatch at all, while others gave a variety of chickens of all sizes and colors. This seemed to be the experience of most of

Last year, however, we began to bear visiting Mr. C. S. Cooper's poultry yard to look at his Wynndottes, we noticed pen of unique and strikingly handsome birds, different from anything we had ever seen before. At first sight they seemed to be small dark Brahmas, but an examination quickly showed that they "What are those birds, Mr. Cooper?"

'sport' from the old black Patagonians."

The birds were so handsome that we excellent likeness of the han. "Princiss" weighs about 61 pounds She is dark gray in coler, with delicate

white penciling in the feathers. Her legs are short, yellow in color, and lightly feathered. The comb is small and fully protected by a crest or "top knet," which gives the birds an airy and spirited appearance. The body is round and plump, with an astonishing amount of breast meat. In fact, if one could take a small

PROWN PATAGONIAN HEN "PRINCESS." dark Brahma ben, change her color i little, diminish the size of her comb, add from her legs and make them shorter, thicken her body and add breast meat and double her intelligence he would

have a hen like "Princess." Regarding the crigin of the brown Pathgenians Mr. Cooper tells that he bought a breeding pen of black birds for pure Phiagonians. The first season he Cotained a few brown chicks from their eggs, reserved the chicks and sold the original black ones. The succeeding season he had a mixture of brown and black chicks; preferring the browns, he disposed of the blacks and reserved browns only. These are the counterpart of the original purchase except in color. They are said to be hardy, fair layers of

eggs and good table birds. Mr. E. L. Pratt, of Beverly, Mass., an address before a farmers' meeting in Boston, said on the subject of hives "For either box or extract honey the eight frame size is about right, though . have been successful with seven Langstroth frames to the hives. It is matural for bees to store honey over the brood, therefore all hency receptacles should be adjustable to the top and directly over the frames, so arranged that two or more can be tiered up, according to the amount of honey being gathered. The standard in the majority of tuses.

At this same meeting Mr. W. W. Rav. sachusetts market gardener, told that he is obliged to keep from fifteen to twenty awarms of bees to use in creenhouses for the fertilization of cucumbers. He is confident that if he did not have been be would have no cucumbers, as he does not attempt to fertilize by hand. Mr. Lyon, who has had considerable experience with foul brood, said, at the meeting of the International Beckeepers' association, that he had tried all the drugs recommended without success, and finally shook a colony into a new hive on comb foundation and was surprised to find them all right after that. L. W Baldwin told at this same meeting that

bees out of the hives upon sheeds of foundation. What Others Say. Says Rural New Yorker: A commercial bushel of potatoes weighs as much as a bushel of wheat, but the bushel of potatoes is four-fifths water, and it ought to be, and is, as easy to grow five bushels of potatoes as one bushel of wheat. And yet it is not uncommon for a bushel o potatoes to command as high a price as

bushel of wheat, W. L. Rutherford, a successful breede of Jersey cattle, says: In selecting breed-ing stock see that the dam is individually good; that the sire has an unbroken pedigree and is of a good strain, and espe-eially that he has a good dam. It is an old saying that "the bull is half the herd." In my own experience I find the influence of the dam on the offspring to be greater than that of the sire.

# Reach the Masses!

"How shall we reach the masses?" asked a religious paper. Dear brother, you can best reach them with a spoon. Go for them with a knife and fork. Humanity's tender point is its paunch. The conscience of man may be seared as with a hot from but his man is ever open to impressing. His adelloct may be stunted, but his appetite is a giant. Take him to the concert or the theatre, and he comes away to seek the nearest feeding place where he may gorge himself before he siceps. The ittle struggling church that bankrupts itself still futhor by venturing on a lecture course, finally lifts Itself clear out of debt oy a series of suppers. A man who will not pay fifty cents for abook willdump one dollar and fifty cents' worth of dinner into his system. A picnic without ten parts of feed to one part of band, is a flat failure. When we "rocelve" a distinguished uest, we feed him: when we say "good-bye" to an eminent cilizen, we give him semething to cat, we have a feast for the wedding great luncheon for the watelers, and a light collation for the mourners. There are a thousand restaurants to one ibrary, yea, more. Hiy-and-by, if the principles of evolution be true, this world will be peopled by race of stemachs with egs and arms. The lens will be needed to earry the stomach to the trough and the arms to fill it up.

utions to He Taken in Laying Tiles at to Insure the Effectiveness and Permanency of the Draining Operation. Board Trough In Drains.

Next to perfect grading of the bottom the effectiveness and permanency of the whole draining operation depends on the careful laying of the tiles. The work should never be intrusted to a raw hand, unless the latter is endewed with an unusual amount of common sense, skill and intelligence. It is not safe to run the least risk of having this important work slighted. Following are instructions given by T. Greiner in the work just mblished by William Henry Maule, entitled "How to Make the Garden Pay:"

Laying the tile should follow imme diately upon the leveling (grading) of the bottom, and in order to perform this task-without stepping into the ditch a six fuet pole with a one-quarter inch iron red fastened to the end and bent in the form of an elbow is used to handle section after section of tile, and placing it in its proper place. The ends should be closely fitted together, and clay subsoil firmly packed around them to held them in their place, until the ditches can be filled up again to the top. Fine surface soll or anything that will decay should not be put immediately in contact with the tiles. It is also essential that the point of discharge in the laterals should be a few inches above the level of the main, to insure a good flow. It is olvious that the tiles can be laid directly upon the bottom of the ditch when the subsoli is perfectly hard and solid, especially if of stiff clay. Soft muck or quickeand in the bettern of drains makes it necessary to rest the tiles upon a line of narrow six inch boards placed in the

drain, as here illustrated, In some instances tile cannot le readily obtained, at least not without paying heavy transportation expenses, and other means of constructing the drain have to be found. I have used board trongis with excellent results. The poorest kind of lumber may be utilized for this purpose. Two boards are nailed togother at right angles and held firmly in place by strips uniled diagonally across. Such tronghs may be placed directly upon a carefully graded, hard, stiff clay bettom, or upon a line of boards placed upon seft bottom in same way as the tile. Stones and pebbles, where plentiful, can be used to good advantage also; but to get a properly constructed drain with such material the inexperienced owner wil always find it safest and cheapest to have the work done by somebody that understands it. Tile is always lest, and drains thus made will be of more lasting value. All stone drains are quito liable to get choked up after nwhile, since it is almost Impossible to keep the soil from washing and working among the stones, and finally fill up the throat.

DOARD TROUGH IN DOTTOM OF DRAIN often they give out quite mexpectedly, making it necessary to take up parts of them for repairs. In an emergency of this kind it is quite convenient to know the exact location of every drain and to he able to find it without having to dig over a large area. A map showing the location of every tile drain put down, with distances marked in rods and feet, will be of great advantage and a valuable assistance sooner or later.

#### How to Kill Quack Grave The following conversation took place at a New York Farmers' Institute: "What is the best way to kill qnack

E. Van Alstyne-By summer fallowing and not allowing it to grow any all summer, or by putting in hogs enough to root it out. This can be done by fencing off the patch and scattering corn over it to induce the hegs to root.

Col. Curtis-The roots of quack are very sweet and palatable. These make fine food for hogs. Mr. Van Alstyne is right-convert them into pork. It can be done easily. The quack patch is just the place for the little plgs, as they will be active in digging the roots ont, and there is nothing better for them, together with grain food, as the roots will make the bulk they require and keep which to apply the salt water. Begin its them healthy; besides, they are very use a month before the plow begins and ter to the acre, sown hroadcast, will prefattening. Quack grass has the most value under the ground, and the pig is the natural factor to utilize it, only give him a chance.

The Fowls for a Gourman "Trixie" believes the Leghorns the only fowls for a gournand. Henry Hales thiuks a Dorking influitely superior to all others; Irving Crocker extols the Wyandottes; Uncle Felch claims the Brahmas as the champions, while Rudd, Thompson and others find the Plymouth Rock the finest table fowls in the land. We always believed in the Wyandotte, but past experience brings to our mind flie toothsome meat of the game fowl, and, honestly speaking, the game stands very close to the front under all conditions, says a contributor to The Fancier's

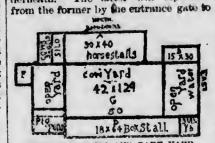

Bees Abecording for Lack of Food. A frequent cause of the desertion of bees from their hives is short stores. The preventive for this state of affairs is apperent, and yet amateurs are always asking what to do. There is no better advice, perhaps, than that given by Root in his book on bee culture, namely: After the bees have swarmed out and are put hack into the hive give them a heavy comb of sealed stores if you can; If not, feed them a little at a time and sealed stores if you can; If not, feed them a little at a time and sealed stores if you can; If not, feed them a little at a time and sealed stores if you can; If not, feed them a little at a time and sealed stores in a perfect specimen. Her evenuess of form, thickness of fiesh and general fine appearance leave little, if anything, to be desired. feed them a little at a time until they have plenty, and be sure that they have brood in the combs. If necessary give them a comb of unsealed larve from some other hive, and then feed them until they have a great abundance of food:

Chicken Items.

Col. Curtis, of Saratogs county, N. Y.,
mys: Gapes are caused by a worm. A
remody is to make the chicken inhale dust. Sometimes it kills the worm

FARM BUILDINGS.

Those Multiplied and a Covered Burn Yard Resulted. Flight years ago, writes a Pennsylvania farmer in Moards' Dairyman, the only buildings on my farm were those on the accompanying sketch marked "A," 30 by 40 with 20 foot posts, and "B," 15 by 30, with 10 foot posts. The former had a baru floor through the centor 14 by 30 feet, and was elevated on a stone wall on three sides, high enough for stables underneath. The latter was separated

FARM BUILDINGS AND BARN YAND. the harn yard, which was simply an inclosure surrounded by a board fence south, and was admirably arranged so that all the liquids could run away nicely, heaving the yard always dry. The same antunn I ackled the building "C," 20 by ndicated on the sketch.

The following spring I saw so many dollars going down the slope in the golden liquid that I determined to make a basin of the clay soil of which the yard was formed. This I did by making it about thirty inches deeper in middle than at edges and a regular dish shape. At the same time I found a necessity for more stable room, and a little later erected the shed "D," 16 feet by 04 feet, divided into six box stalls, with one entry on the south side.

As more room was needed in a year or wo, the buildings "E," 24 feet by 32 feet for pig pens, and "F," 16 feet by 20 feet. with posts 2i feet, for tools underneath and fodder above, were erected, This, it will be observed, nearly snr-

rounded my barn yard with huildings,

except on the east and a small section on the south and west, and although all roofs were apouted to carry away the water, we began to experience the serious difficulty of too much water. The yard held all the water that fell in It and the full length of high top rubber boots was necessary to enable us to get about. As a temporary relief we had to cut a channel out one side of our dish and let the golden liquid flow away again. It began to dawn upon me that a covered barn yard would be a good thing, and as the farm was becoming more productive and more room necessary—barn floor space being especially deficient—the following plan was resorted to: The space marked "G," 42 feet by 50 feet, was cevered by a barn, with posts 20 feet. This barn was set on sixteen posts of round white onk about fourteen inches in diameter, mounted on stone pedestals and high enough so that the threshing floor came level with the old barn floor and line with it. This increased our threshing floor to 72 feet in length and covered a large area of the yard. This seems to meet the required want. It furnishes a

Grasses for Hay. Clover, timothy, orchard grass, red top and linngarian or millet are the sorts most usually grown for hay. For ceding out on the farm with all classes of stock, red clover stands at the head It can be sown in the spring on wheat or with oats or by itself. It grows rapidly and gives a good yield if the season is at all favonable. In addition to making a good feed, whether pastured or harvested and made into hay, clover is one of the best creps to aid in building up the fertility l'imothy is one of the best grasses fer But tile drains, if ever so well laid, cannot be expected to last forever, and market timothy will return the best profit, as it sells at a higher price than

in cooler wenther, and protects the ma-

any other kind.

Eed top makes a good hay; it ripen after clover and timothy and is better adapted to growing on thin land than either of the others. It can be sown in the usual way. Drehard grass on reason-ably good land makes a good growth and yield, the only objection being its inclination to grow in stools, but this can b woided by using plenty of seed and seenring a good even stand all over the urface. Hungarian or millet makes good hay, especially for cattle or sheep and on good rich soil, well prepared and in a favorable season, will give n large yield of hay. It is an annual and must be sown each year, and is not a profitable grass to grow on thlu land. It can be sown the latter part of May or the first of June, and care must be taken to pre-

ug.—Prairie Farmer. Galled Shouklers. John M. Stahl wrote fifteen years ago that the best preventive of galled shoulders is to bathe the shoulders each evening with salt water. He has written it several times since, and he again calls attention to it in The Farm Journal. He

Applying Commercial Pertilizers. as evenly as is possible. Then even the surface with a good steel rake; work the fertilizer well into the soil. With ail cool place in summer and a warm place this class of plants the fertilizer needs to be near the surface in order to benefit nure from bleaching rains and bleaching them. With cabbago, tomatoes and all the class of larger vegetable plants make the place for the plants, using a dibble or garden trowel. Int ln the fertilize and stir it in well with the soil and then set in the plants. With sweet corn, po tatoes and this class of plants prepare the soil and mark out the furrows ready for the seed. Drop the fertilizer where the seed is to be planted, stir iuto the soil, then plant and cover the seed. Gen erally this will be found better, especially with potatoes, than to wait until the plants come up and then apply commer

cial fertilizers. A Few Sheep Wrinkles. Northwest Stockman discourses as fol lows: Old, broken mouthed ewes are dear at any price. If they cannot be sold to the butcher feed them to the crows in the fall-they will get them anyhow before "tire voice of the turtle is heard in

the land." All sheep are subject to both internal and external parasites. Feed them occasionally a little hardwood ashes or finely pulverized tobacco, which will free then rem worms and improve their general health. Dip them thoroughly in some approved sheep dip, and there is nothing better than a preparation of tobacco.

Do not overstock; better keep too few rather than too many. If a flock of 100 sheep could be made as profitable as a flock of ten, shepherds would be clothed in purple and fine linen. Mix a little sulphur with their salt; it enriches the blood and disagrees with ticks and other parasites.

Gypsum for Clover. The plants that derive profit from gypsum include all known to the agriculturist, but some more than others profit by the fertllizer, says American Cultivator Clover stands at the head of the list as one responding quickly to the application, and it will often make all the difference between a good and a bad crop of coutinue it through the working season.
